

EMP Testing

All our EMP protectors have passed through several stages of testing.

There is also one final inspection and electrical test on our manufacturing inspection and electrical test on METEOLABOR's automatic testing system prior to released to the customers.

The automatic inspection system follows instructions programmed on a PC and fires a serie of EMP pulses against the device and logs the results.

As of 2016 we started upgrading our devices from being threat level compliant to MIL-STD-188-125 (the whole system works after a NEMP) to 100% full single device compliance. This is more and more requested by our customers. To achieve this, we are using our own Montena E1generator.

The picture shows a USP-74101 in final inspection test.
